## *Hay and Haylage*

# *Turners & Mergers*

The PhiBer swath turner is designed to handle hay gently in all conditions. PhiBer has taken the principle that hay dries 80% by air and 20% by sun and designed a turner that will fluff the hay allowing air to travel through the row. Shown here is a double model merging two rows into one.

This haylage merger (right) has an optional extended draper. This allows you to merge up to three 21' rows together (leaving a 9' wide windrow). The advantage of using a PhiBer merger is that it lays out a row with no lumps and does not pick up stones, making chopping a pleasure.

**PHIBER**

PhiBer swath turners can be equipped with optional reverser switches allowing the drapers to be bi-directional. This allows the operator to either bring two rows together or turn/fluff them individually. The turner shown here is equipped with optional inverter chutes.

The optional haylage pick-up includes a front haylage roller, this allows the operator to pick up wet hay in light or heavy crop conditions.

## Specifications

	<b>Single</b>	<b>Double</b>
Pick up width	8' or 10'	8' or 10'
Draper width	42"	42"
Transport width	12'	15'
Hydraulic requirements	12 gpm minimum	18 gpm minimum
Bi-directional draper	Optional	Optional
